EgoTECH

DEPLOYMENT CHECKLIST

EgoTECH PDF Vault — Document & Image Storage System

Document Type	Deployment Checklist
Project Name	EgoTECH PDF Vault
Organization	EgoTECH
Version	1.0
Date	October 20, 2026

1. Purpose & Scope

This Deployment Checklist provides a structured, step-by-step guide for deploying the EgoTECH PDF Vault application (version 1.0) to a target environment. It is intended for DevOps engineers, system administrators, and developers performing or overseeing the deployment process.

The checklist covers pre-deployment preparation, backend and frontend deployment, environment configuration, smoke testing, and post-deployment verification. Each item must be reviewed and signed off by the responsible party before the deployment is considered complete.

2. Deployment Details

Field	Value
Application Name	EgoTECH PDF Vault
Version	1.0
Deployment Date	October 20, 2026
Deployment Environment	Production / Staging (circle one)
Deployed By	_____
Reviewed By	_____
Target Server OS	Windows 10/11 or Linux (Ubuntu 20.04+)
Backend Port	8000
Frontend Port	5173 (dev) / 80 or 443 (production)
Database Engine	SQLite 3 (v1.0)

3. Phase 1 — Pre-Deployment Preparation

3.1 Environment & Infrastructure

#	Checklist Item	Status
1	Target server is provisioned and accessible via SSH or RDP.	Done
2	Python 3.10 or later is installed on the server (verify: python --version).	Done
3	Node.js 18.0 or later is installed (verify: node --version).	Done
4	npm 9.0 or later is installed (verify: npm --version).	Done
5	Git is installed and the repository has been cloned to the target server.	Done
6	Sufficient disk space is available (minimum 500 MB free, plus storage for uploaded files).	Done
7	Required ports (8000 for backend, 5173 or 80/443 for frontend) are open in the firewall.	Done
8	A dedicated application user account (non-root) has been created for running the services.	Done
9	Server time and timezone are correctly configured.	Done
10	Antivirus / endpoint protection is configured to exclude the storage directory from real-time scanning.	Done

3.2 Source Code & Repository

#	Checklist Item	Status
11	Latest stable code has been pulled from the main branch of the repository.	Done
12	git log shows the correct commit hash for the release being deployed.	Done
13	No uncommitted changes exist on the server (git status is clean).	Done
14	The .gitignore file correctly excludes .env, __pycache__, node_modules, and storage/.	Done

3.3 Backup & Rollback Plan

#	Checklist Item	Status
15	A full backup of the current production database (storage/pdf_vault.db) has been taken.	Done
16	A backup of the entire storage/pdfs/ directory has been taken.	Done
17	The previous deployment version tag / commit hash is documented for rollback.	Done
18	Rollback procedure has been communicated to and understood by the deployment team.	Done
19	A maintenance window has been communicated to end-users if applicable.	Done

4. Phase 2 — Backend Deployment

4.1 Environment Configuration

#	Checklist Item	Status
20	backend/.env file has been created from backend/.env.example.	Done
21	APP_NAME is set to the desired API display name.	Done
22	API_PREFIX is set to /api/v1 (or the agreed prefix).	Done
23	CORS_ORIGINS is set to the correct production frontend URL(s), comma-separated.	Done
24	MAX_UPLOAD_MB is set to the agreed upload size limit (default: 25).	Done
25	STORAGE_DIR is set to an absolute path on the server with write permissions.	Done
26	DATABASE_URL points to the correct SQLite file path (or updated for PostgreSQL in future).	Done
27	AUTH_SECRET is set to a strong, randomly generated secret of at least 32 characters. NOT the placeholder value.	Done
28	AUTH_TOKEN_MINUTES is set to the agreed session duration (default: 60).	Done
29	The .env file has restricted file permissions (readable only by the application user).	Done

4.2 Dependency Installation

#	Checklist Item	Status
30	Virtual environment created inside backend/ (recommended: python -m venv .venv).	Done
31	Virtual environment activated before proceeding.	Done
32	pip install -r requirements.txt completed with no errors.	Done
33	All required packages are present (fastapi, uvicorn, sqlalchemy, pydantic-settings, python-multipart).	Done

Verification command:

```
pip list | findstr -i "fastapi uvicorn sqlalchemy pydantic"
```

4.3 Storage Directory Setup

#	Checklist Item	Status
34	storage/pdfs/ directory exists and is writable by the application user.	Done
35	storage/pdfs/images/ subdirectory exists and is writable.	Done
36	Database file storage/pdf_vault.db is present (or will be auto-created on first start).	Done

4.4 Backend Service Startup

#	Checklist Item	Status
37	Backend started with: python -m uvicorn app.main:app --host 0.0.0.0 --port 8000	Done
38	Startup logs show 'Application startup complete.' with no errors.	Done
39	Health endpoint returns HTTP 200: GET http://<server>:8000/api/v1/health	Done
40	Root endpoint returns HTTP 200: GET http://<server>:8000/	Done
41	Swagger UI is accessible: http://<server>:8000/docs	Done
42	For production: Backend is registered as a system service (e.g., systemd, NSSM on Windows) to auto-restart on reboot.	Done

5. Phase 3 — Frontend Deployment

5.1 Configuration

#	Checklist Item	Status
43	frontend/.env file has been created from frontend/.env.example.	Done
44	VITE_API_URL is set to the correct backend URL (e.g., http://<server>:8000).	Done

5.2 Dependency Installation & Build

#	Checklist Item	Status
45	npm install completed inside the frontend/ directory with no errors.	Done
46	npm run build completed successfully — dist/ directory created.	Done
47	The dist/ directory contains index.html and assets/ subfolder.	Done

5.3 Frontend Serving

#	Checklist Item	Status
48	For development / staging: npm run dev starts successfully on port 5173.	Done
49	For production: dist/ is served by a web server (Nginx, Apache, IIS, or Vite preview).	Done
50	The frontend is accessible in a browser at the designated URL.	Done
51	Browser console shows no critical JavaScript errors on initial load.	Done
52	Login page renders correctly.	Done

6. Phase 4 — Integration & Smoke Testing

6.1 Authentication Tests

#	Checklist Item	Status
53	New user registration succeeds (POST /api/v1/auth/register returns 201).	Done
54	Duplicate registration correctly returns HTTP 409.	Done
55	Login with correct credentials returns HTTP 200 and a JWT token.	Done
56	Login with wrong password returns HTTP 401.	Done
57	Authenticated request to /api/v1/auth/me returns the user profile.	Done
58	Request without token to a protected endpoint returns HTTP 401.	Done

6.2 Document (PDF) Tests

#	Checklist Item	Status
59	A new folder can be created via POST /api/v1/documents/folders (HTTP 201).	Done
60	Folder list returns the created folder (GET /api/v1/documents/folders).	Done
61	A valid PDF can be uploaded to the folder (POST	Done

	/api/v1/documents, HTTP 201).	
62	Uploading a non-PDF file returns HTTP 415.	Done
63	Uploading a file exceeding MAX_UPLOAD_MB returns HTTP 413.	Done
64	Uploaded PDF appears in document list (GET /api/v1/documents).	Done
65	PDF can be downloaded and opens correctly (GET /api/v1/documents/{id}/download).	Done
66	PDF can be deleted (DELETE /api/v1/documents/{id}, HTTP 204) and no longer appears in list.	Done
67	Deleted PDF file is removed from the filesystem.	Done

6.3 Image Tests

#	Checklist Item	Status
68	Image category can be created (POST /api/v1/images/categories, HTTP 201).	Done
69	Image (JPEG/PNG) can be uploaded to category (POST /api/v1/images, HTTP 201).	Done
70	Image is served correctly (GET /api/v1/images/{id}/file).	Done
71	Image can be deleted (DELETE /api/v1/images/{id}, HTTP 204).	Done
72	Deleting a category removes all its images (DELETE /api/v1/images/categories/{id}).	Done

6.4 Frontend End-to-End Checks

#	Checklist Item	Status
73	Login page: user can register and is redirected to the dashboard.	Done
74	Dashboard: stats bar displays correct document count and storage size.	Done
75	Folder grid: new folder appears immediately after creation.	Done
76	Upload panel: PDF upload shows success notice and document appears in the folder.	Done
77	Search: filtering by filename narrows the document list correctly.	Done
78	Download: clicking download button triggers a browser file download.	Done
79	Delete: document is removed from the list after deletion confirmation.	Done
80	Images workspace: can switch workspace via sidebar and manage images end-to-end.	Done
81	Plans page: navigating to Plans page shows Free/Pro comparison.	Done
82	Logout: clicking Log out returns user to the login page.	Done
83	Session expiry: after token expiry, user is automatically redirected to login.	Done

7. Phase 5 — Post-Deployment

7.1 Monitoring & Logging

#	Checklist Item	Status
84	Uvicorn access logs are being written to a log file or journald.	Done
85	Log rotation is configured to prevent unbounded log growth.	Done
86	Server CPU and memory usage is within acceptable limits under initial load.	Done
87	Disk space monitoring is in place with alerts for low-space conditions.	Done

7.2 Security Hardening

#	Checklist Item	Status
88	AUTH_SECRET is not the default placeholder — a strong random value is in use.	Done
89	HTTPS is configured for production (TLS certificate installed).	Done
90	CORS_ORIGINS does not include wildcard (*) in production.	Done
91	The .env file is not committed to the repository (confirmed via .gitignore).	Done
92	Storage directory is not publicly accessible via the web server (only via API).	Done
93	Python virtual environment directory is excluded from the web root.	Done

7.3 Documentation & Sign-Off

#	Checklist Item	Status
94	Deployment date, version, and server details are recorded in the project log.	Done
95	All checklist items above have been reviewed and signed off.	Done
96	Stakeholders have been notified that deployment is complete.	Done
97	User Manual has been distributed to end-users.	Done
98	Maintenance Agreement is signed and in effect.	Done

8. Deployment Sign-Off

By signing below, the named parties confirm that all applicable checklist items have been completed and the deployment is approved.
